

Fundamentals of Wi-Fi

Tom Bridge, Technolutionary

Chris Dawe, Wheelwrights

Wi-Fi Networks Are An Argument with Physics

Today's Agenda

- A Brief History of 802.11 (90 minutes)
 - Coffee!
- Terminology and Jargon (75 minutes)
 - Lunch!
- Building Good Networks (90 minutes)
 - Snacks!
- Troubleshooting (75 minutes)

A (Not So) Brief History of 802.11

- ✦ The Birth of Wi-Fi
- ✦ Standards We Care About (802.11 a/b/g/n/ac)
- ✦ The 2.4 and 5Ghz spectra
- ✦ The Physical Constraints of Wi-Fi

Terminology & Jargon

- Basic Radio Frequency (RF) Stuff
- Interference
- Attenuation
- AirTime
- Signal
- Noise
- MCS
- Other

Building Good Networks

- ✦ Physical Materials
- ✦ Models for Planning
- ✦ Authentication and Connectivity Control
- ✦ Wireless Bridging

Troubleshooting

- ✦ Is it the Spectra?
- ✦ Is it the Radio?
- ✦ Is it the Device?
- ✦ Is it the Network?
- ✦ Is it Something Else?

Wi-Fi Is Everywhere

How Did We Get Here?

In the beginning was 802.11

Why 2.4GHz?

Because of the Science Oven.

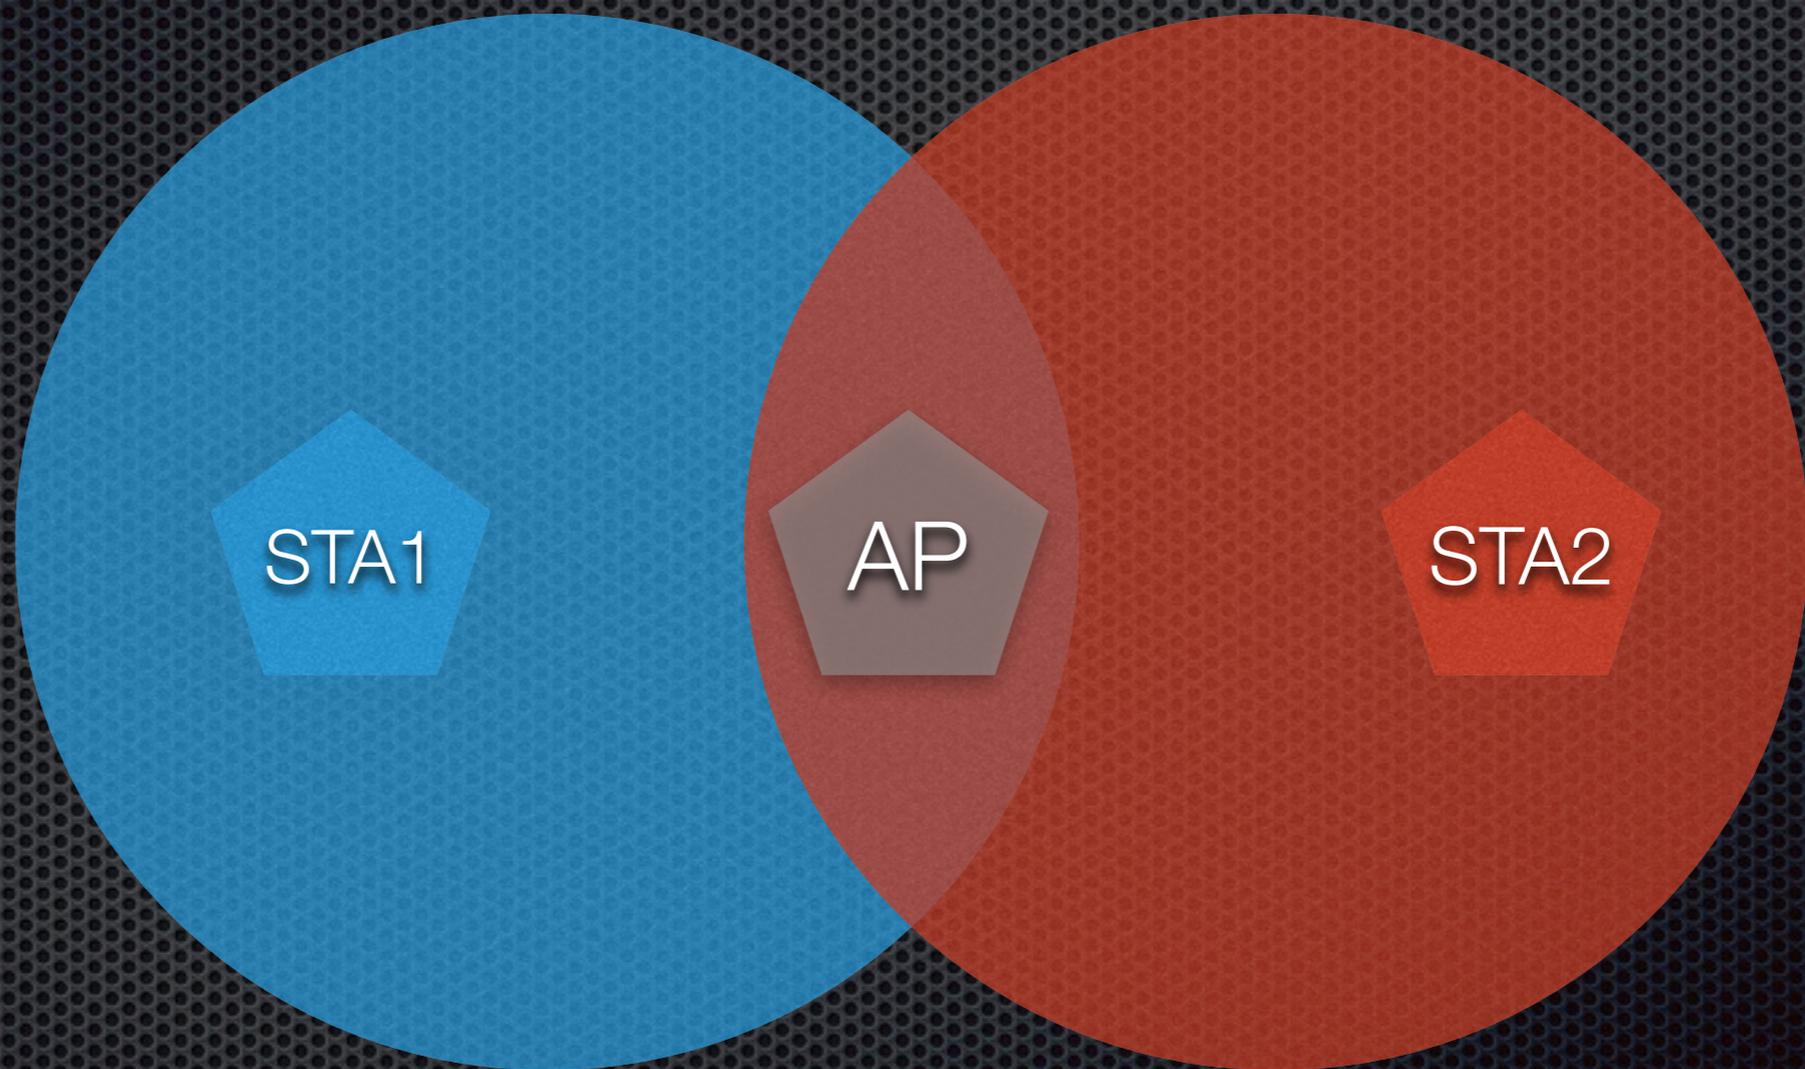

The Ground Rules of Wi-Fi

Physical Layer

- ✦ Each radio is like one big hub - that requires Collision control.
- ✦ There is no Collision Detection in Wi-Fi
- ✦ There is only Collision Avoidance
- ✦ All your comms are Half Duplex

Detection
vs
Avoidance

Why Avoidance?

802.11
(1997)

802.11g
(2003-6)

802.11ac (W1)
(2011-13)

802.11a/b
(1999)

802.11n
(2006-11)

802.11ac (W2)
(2013-15)

1997

2015

802.11 (1997)

- ✦ 2.4Ghz
- ✦ 2Mbps
- ✦ Sets the 20Mhz Channel Width
- ✦ Sets original 11 Channels
- ✦ Frequency Hopping or DSSS

802.11a/b (1999)

- ✦ 2.4GHz for b, 5.8 GHz for a
- ✦ 11Mbps for b, 54Mbps for a
- ✦ WEP Encryption only
(40-bit, then 128-bit, both insecure)
- ✦ Beacon rates can slow the network substantially
- ✦ Uses CCK in b, OFDM in a

802.11g (2003-2006)

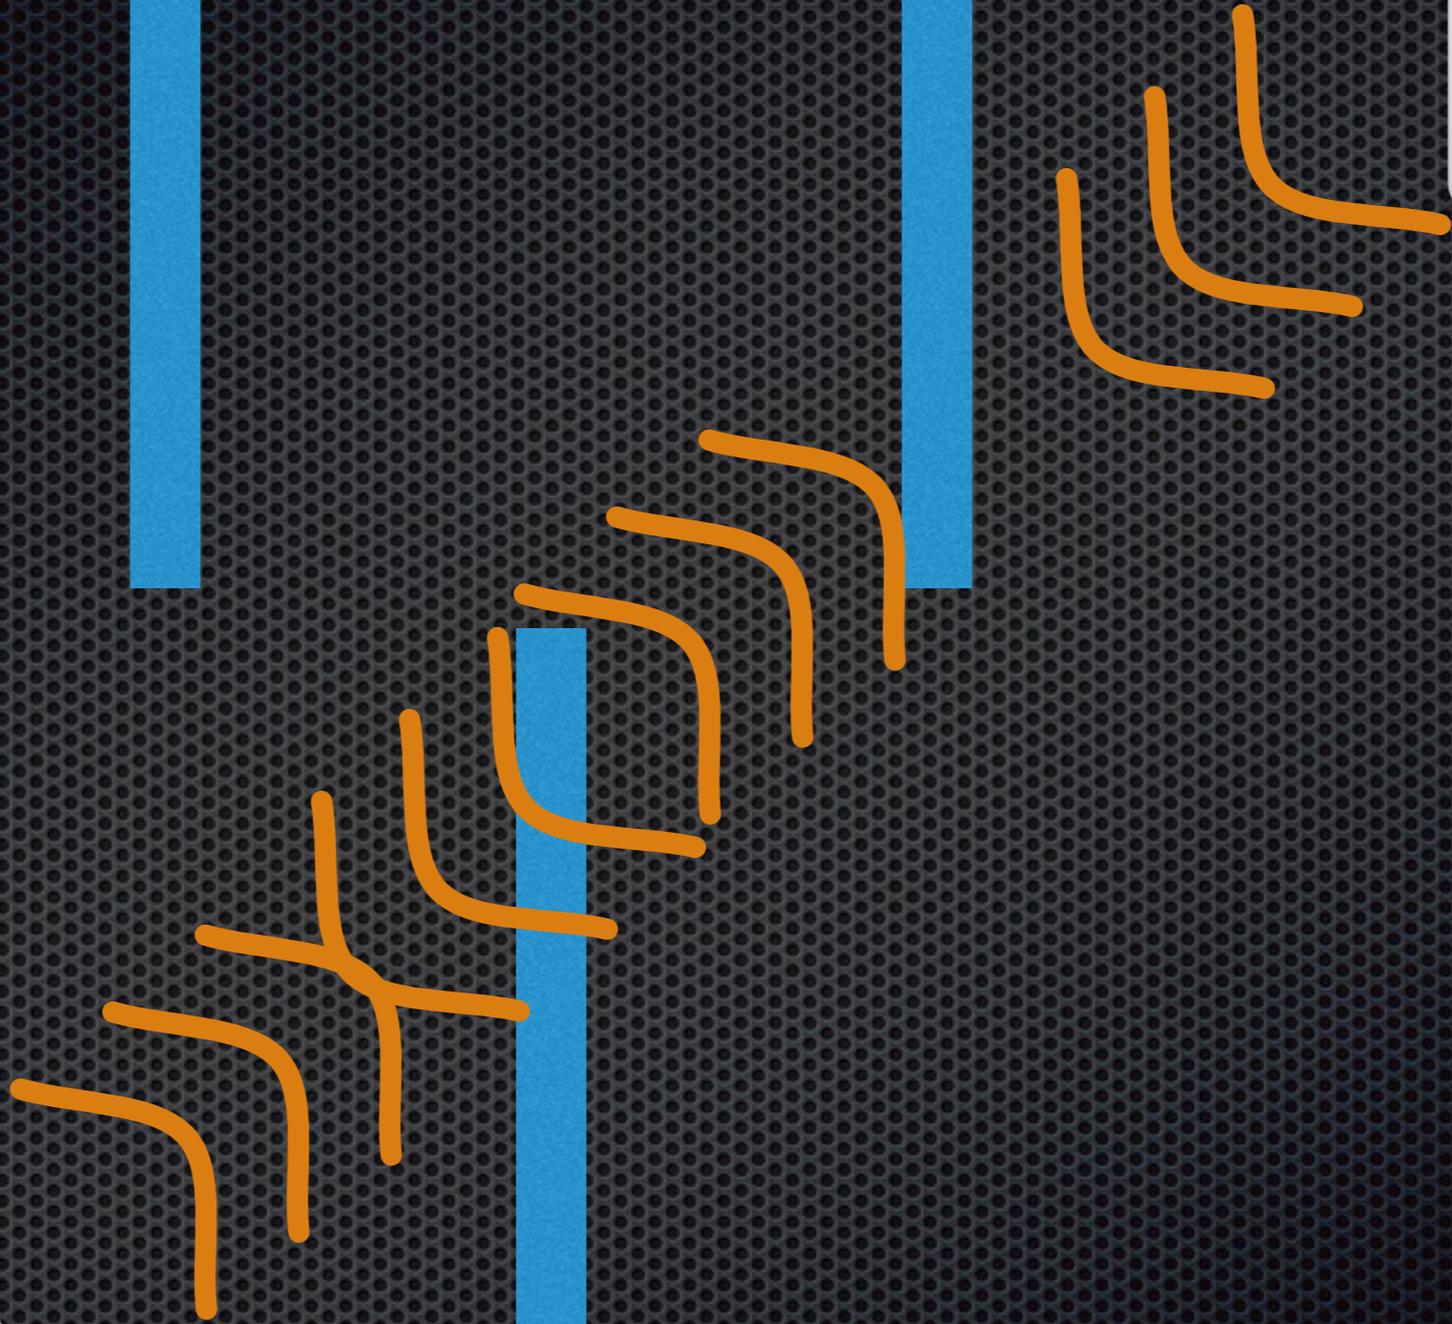

- ✦ Adds WPA Encryption (still vulnerable)
- ✦ Switch from CCK to OFDM to improve interference handling
- ✦ But has to support CCK mode for 802.11b compatibility, which can slow whole networks down
- ✦ 54Mbps comes to 2.4GHz

“But Tom, what about
Wireless Distribution System?”

- *Conference Workshop Attendee, Probably*

Wireless Distribution System

- ✦ What happens when you extend wireless *with* wireless?
- ✦ Consists of Main Base Station, Relay Base Stations, Remote Base Stations
- ✦ Use the same channel, encryption type and key
- ✦ Each WDS link halve the bandwidth

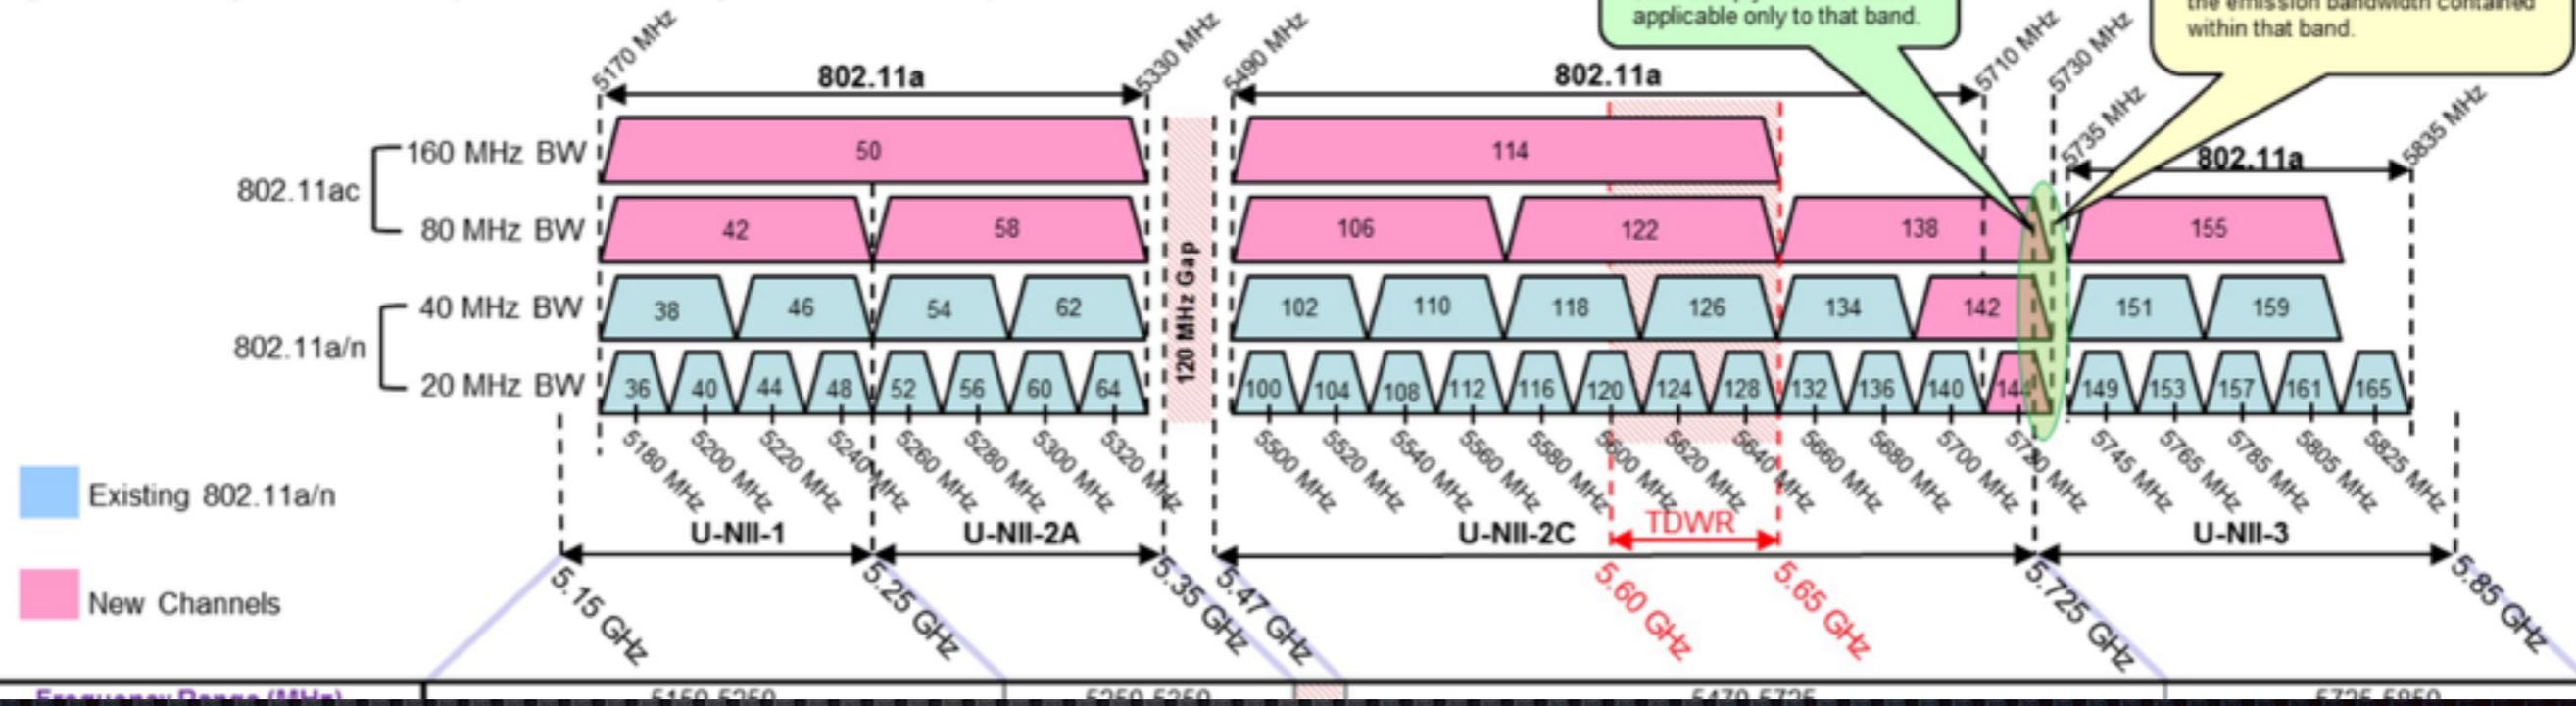

802.11n (2006-2011)

- ✦ 2.4 or 5GHz
- ✦ 20 OR 40 MHz channel widths
- ✦ 600Mbps theoretical max
- ✦ Hello, MIMO
- ✦ WPA2 Introduced, TKIP deprecated, AES introduced

OPERATION IN U-NII BANDS – 802.11 CHANNEL PLAN

§15.407 (Part 15E), 1st R&O (FCC 06-96), effective 6/2/2014

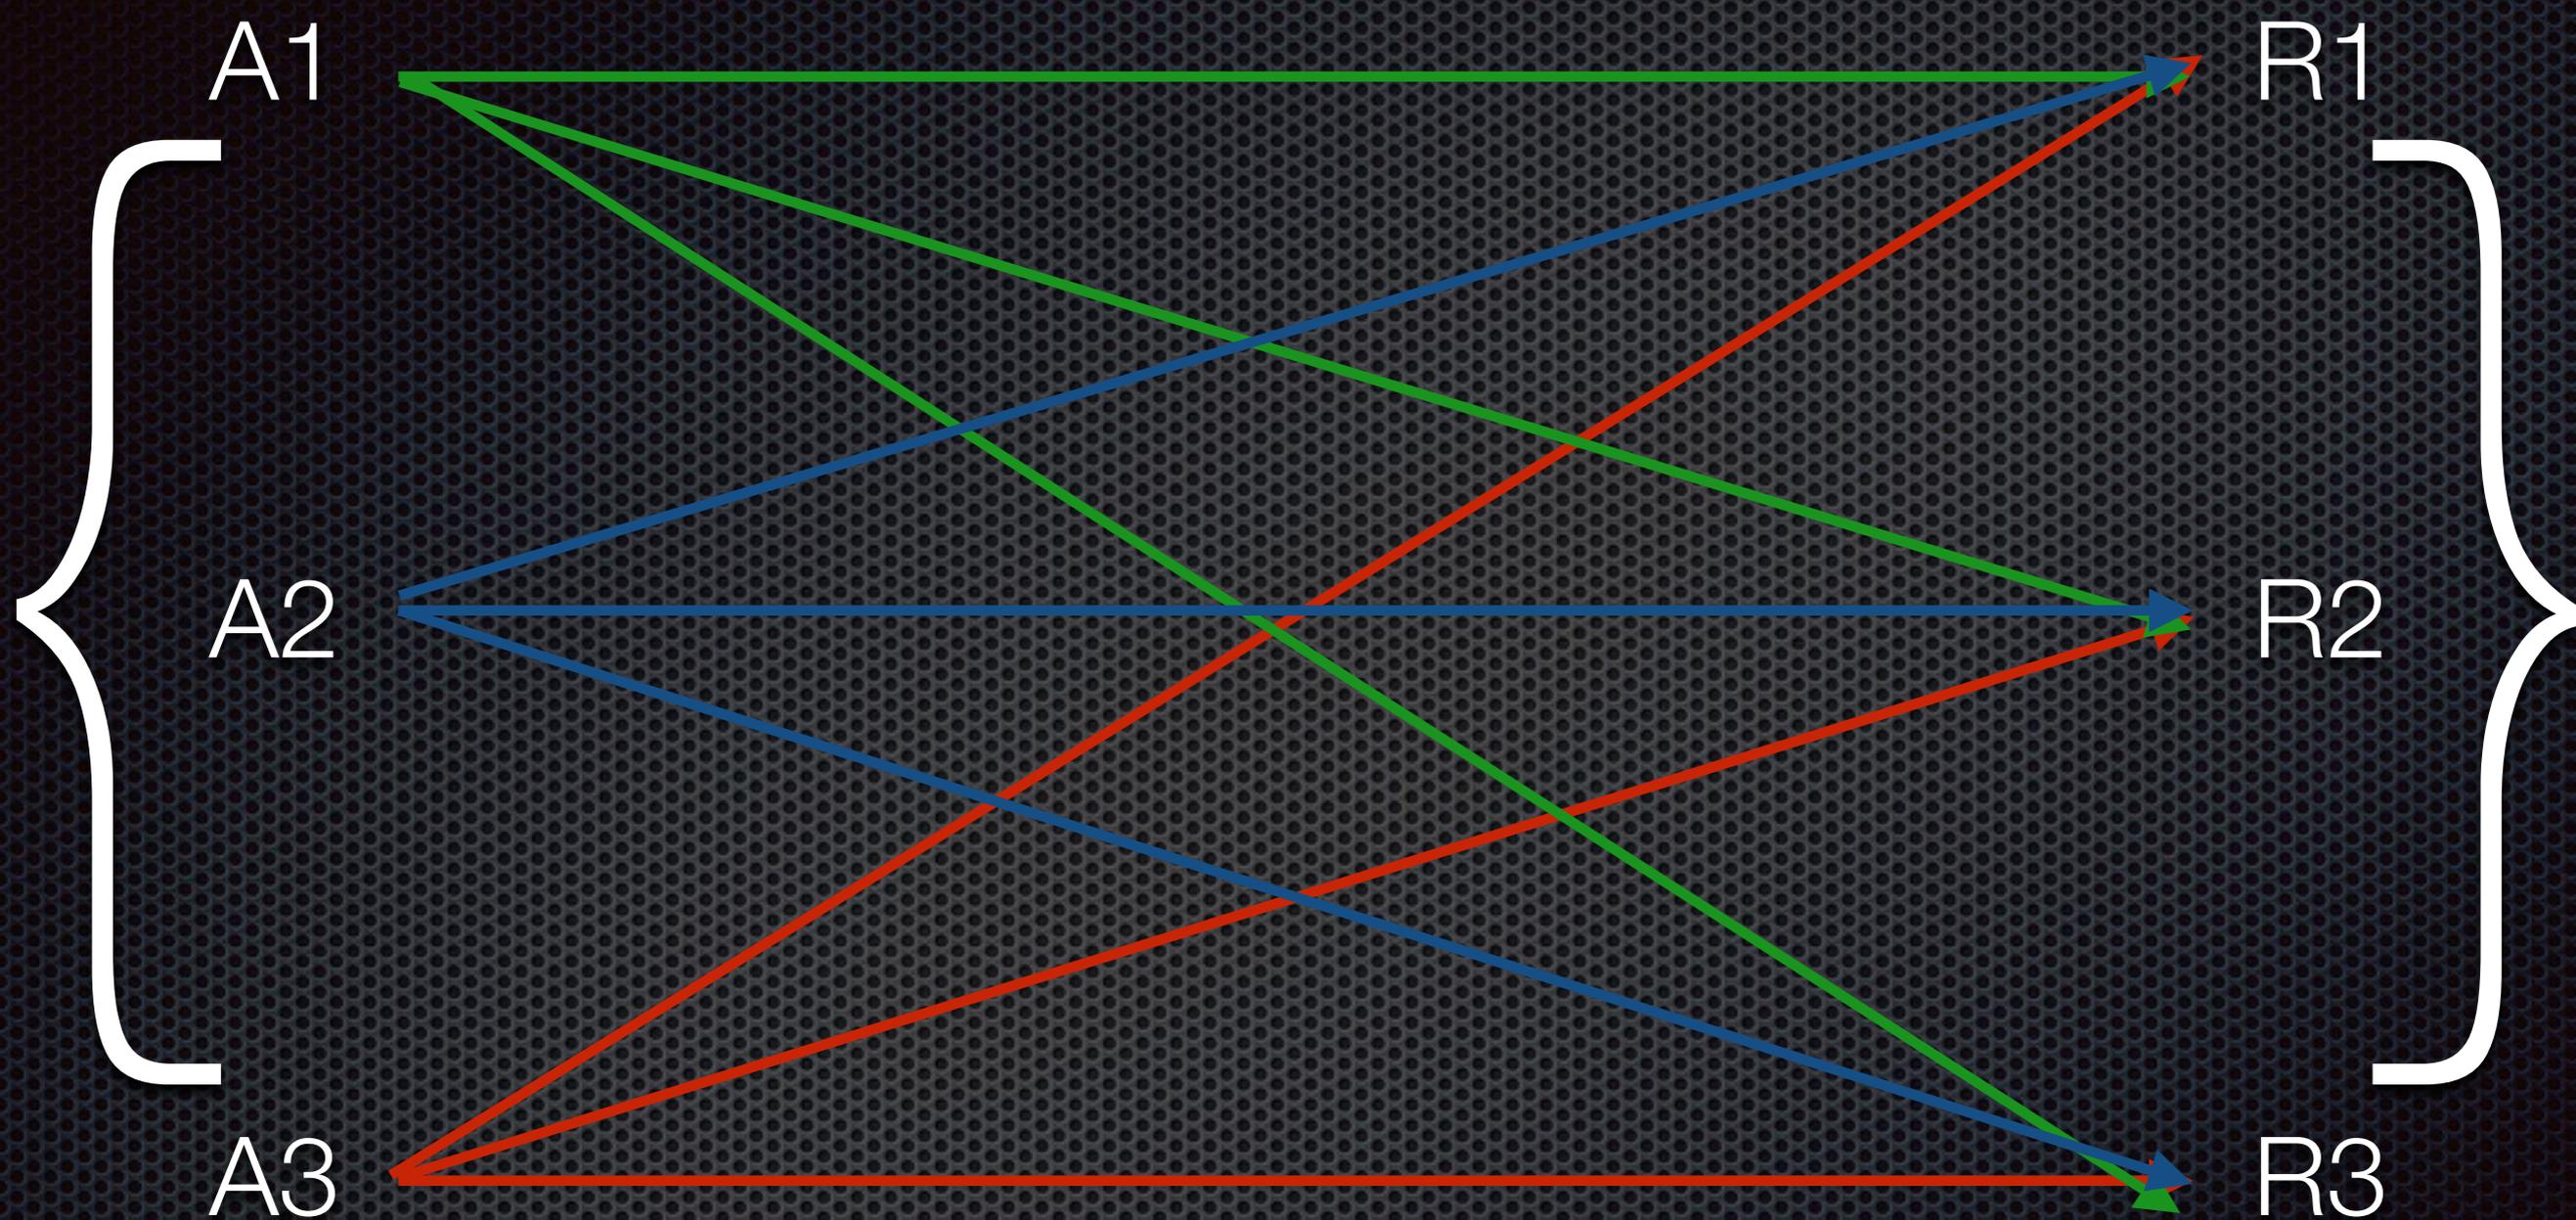

What's DFS?

Terminal Doppler Weather Radars

Dynamic Frequency Selection

What's MIMO?

Multiple In, Multiple Out

What's $T \times R : S$?

802.11ac Wave 1 (2013)

- ✦ 5GHz only
- ✦ 80 or 160 MHz channel widths
- ✦ 1.2Gbps Theoretical Max
- ✦ Can use up to 8 streams
- ✦ Can use 256 QAM

802.11ac Wave 2 (2014)

- ✦ 5GHz only
- ✦ 80, or 160 MHz channel widths
- ✦ 6.9Gbps Theoretical Max
- ✦ That means you need 10GbE to your AP!
- ✦ MU-MIMO!
